Bio-Data Science Task 1 Report

Summary: In this week's task, I carried out two tasks to strengthen my skills inR-programming for data science.

First, I performed simple visualization on the data set "astrocyte_data". I created barplots, histograms, boxplots, added legends and labels. Next, I installed all the packages that would enable me perform ggplots on the data set "aflatoxin_data". I continued to melt data, stack barplots, create pie-chart, histogram and scatter plot while applying colors. I then created heatmaps which I manipulated severally to create what suits my taste.

In conclusion, this task has strengthened my skills in R-programmingfor statistical analysis/visualization.

Explanations of codes and visualizations are provided below:

```
# Mitochondria-endoplasmic reticulum contacts in reactive astrocytes promote vascular
remodelling. Goebel et al.
# I want to perform the comparison of FACS-enriched astrocytes from uninjured and injured
wild-type mice at different time points

# I have already downloaded my data as .csv, next I will import my file in R
astrocyte_data <- read.csv(file.choose())
astrocyte_data

# I want to perform Data Visualization in R

# Let me construct a histogram for the distribution of MFN1_1 Gene
hist(astrocyte_data$MFN1_1, col = "Sea green", main = "Distribution of MFN1_1 Gene",
xlab = "Index")
```

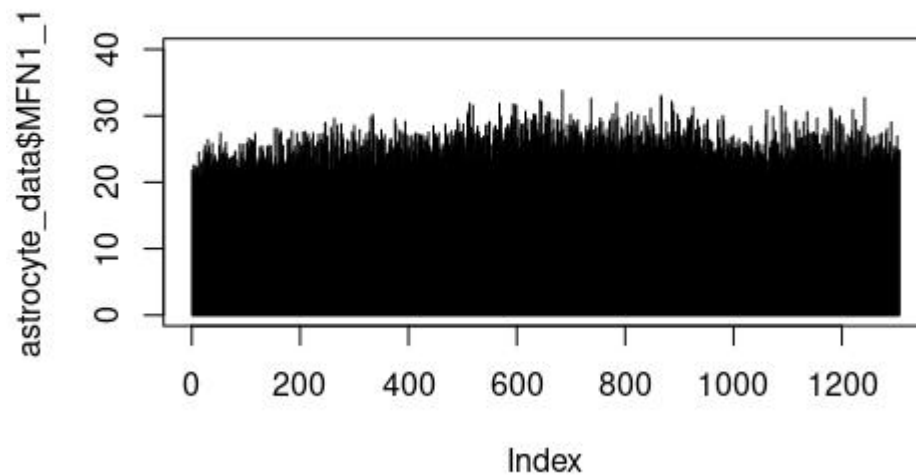

Distribution of MFN1_1 Gene
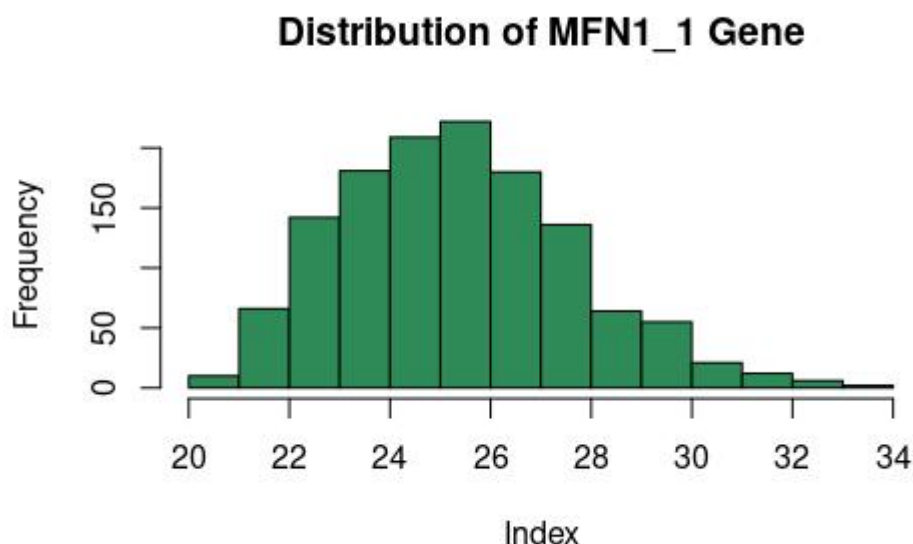

```
# I want to plot lineplots for the distribution of MFN1_1 Gene
plot(astrocyte_data$MFN1_1, type = "h", xlim = c(0,1300), ylim = c(0, 40))
```
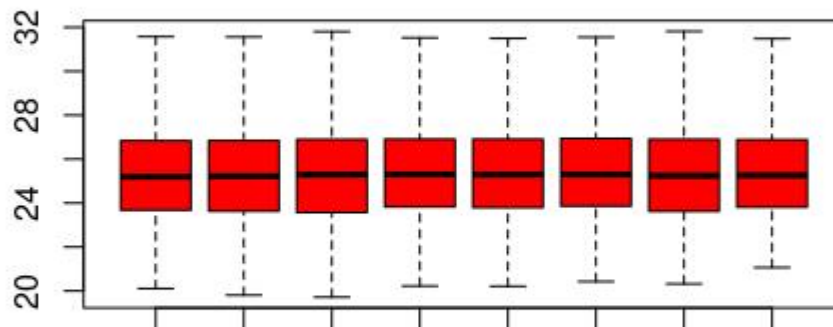

# I want to create black and with boxplots for my genes
boxplot(astrocyte_data$MFN1_1, astrocyte_data$MFN1_2, astrocyte_data$MFN1_4, astrocyte_data$WT_1, astrocyte_data$WT_3, astrocyte_data$WT_4, astrocyte_data$MFN1, astrocyte_data$WT)
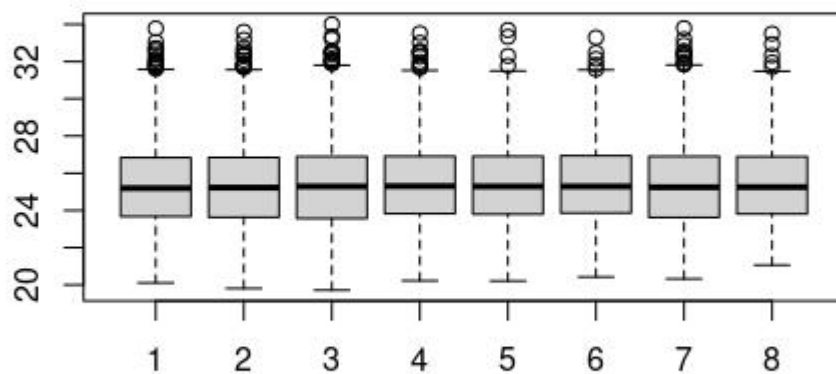

# Let me add red color and title to my boxplot
boxplot(astrocyte_data$MFN1_1, astrocyte_data$MFN1_2, astrocyte_data$MFN1_4, astrocyte_data$WT_1, astrocyte_data$WT_3, astrocyte_data$WT_4, astrocyte_data$MFN1, astrocyte_data$WT, col = 'red', outline = F, main = 'BOXPLOT')
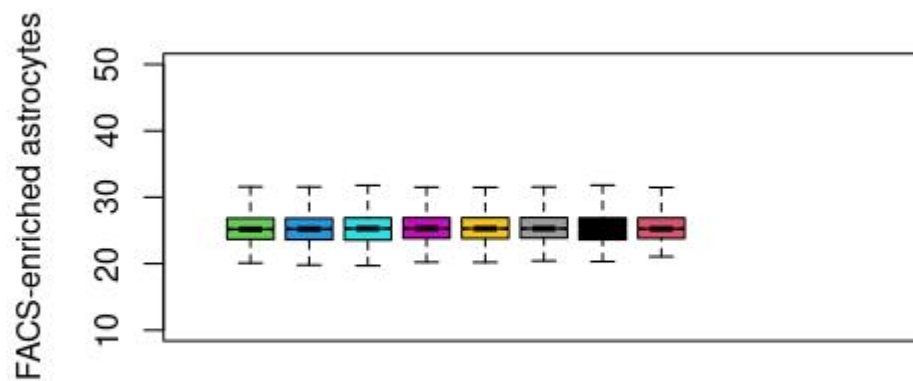

BOXPLOT

I want to color by gene types
boxplot(astrocyte_data$MFN1_1, astrocyte_data$MFN1_2, astrocyte_data$MFN1_4,
astrocyte_data$WT_1, astrocyte_data$WT_3, astrocyte_data$WT_4, astrocyte_data$MFN1,
astrocyte_data$WT, col = 3:10, notch = T, outline = F, main = 'BOXPLOT', xaxt = 'n', xlab =
'Wild-type mice at different time points', ylab = 'FACS-enriched astrocytes', ylim = c(10,50),
xlim = c(0,12))

BOXPLOT

I want to add axis
axis(side = 1, at = c(1,2,3,4,5,6,7,8), labels = c('MFN1_1', 'MFN1_2', 'MFN1_4', 'WT_1',
'WT_3', 'WT_4', 'MFN1', 'WT'))

● MFN1

MFN1_1   WT_1 WT_4   WT

Wild-type mice at different time points
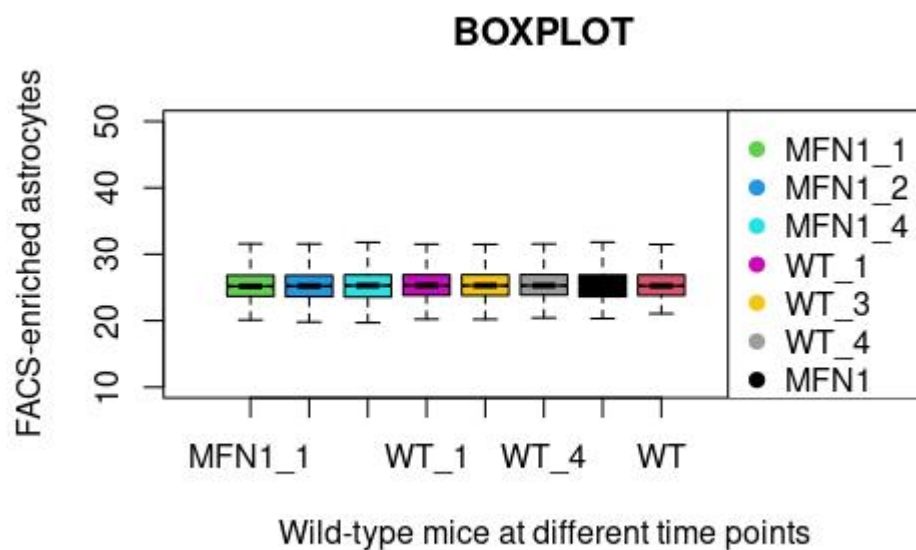

# I want to create a scatterplot of MFN1_1 vs WT_1. I will color it black with a background of blue.
plot(x = astrocyte_data$MFN1_1[1:50], y = astrocyte_data$WT_1[1:50], col = 'black', pch = 21, bg = 'blue', main = 'MFN1_1 vs WT_1', xlab = 'MFN1_1', ylab = 'WT_1', xlim = c(20,30), ylim = c(20,30))
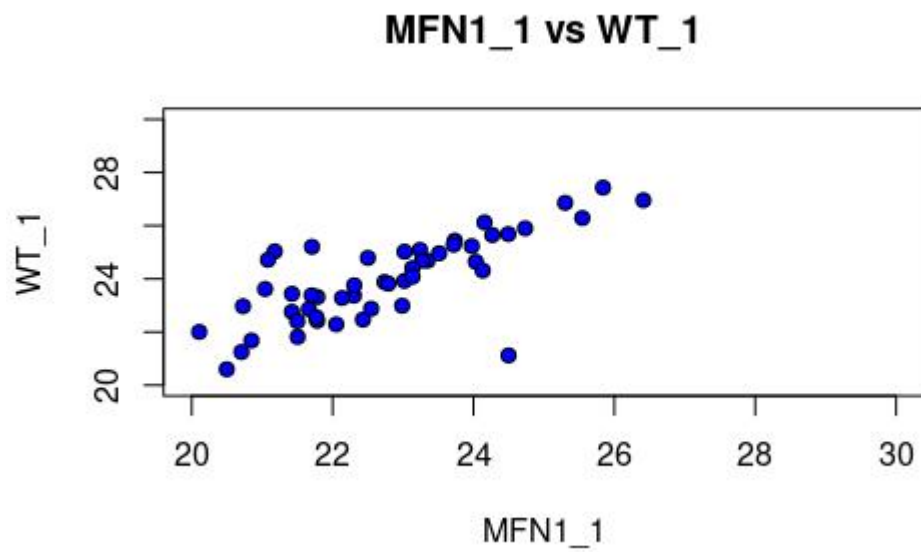

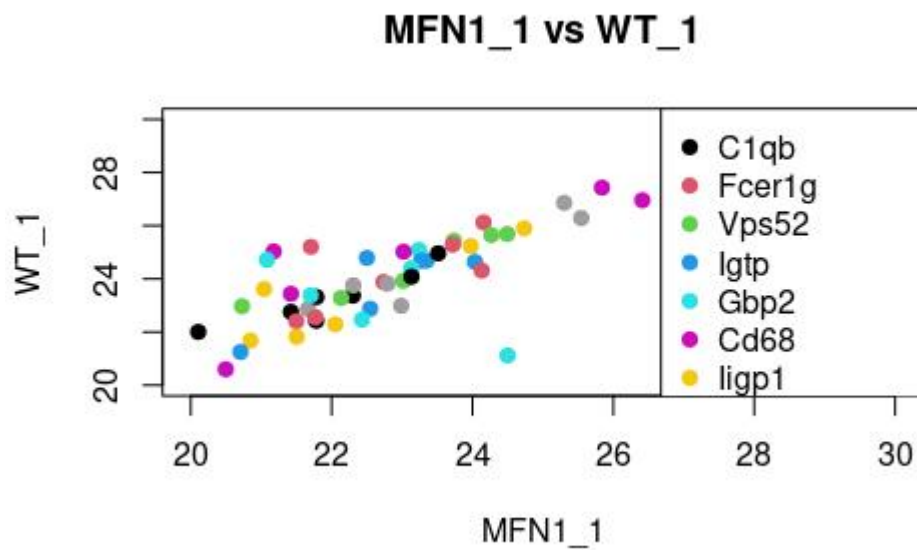

MFN1_1 vs WT_1

```
# I want to color by gene type.
plot(astrocyte_data$MFN1_1[1:50], astrocyte_data$WT_1[1:50], col = 1:50, pch = 19, main
= 'MFN1_1 vs WT_1', xlab = 'MFN1_1', ylab = 'WT_1', xlim = c(20,30), ylim = c(20,30))
```
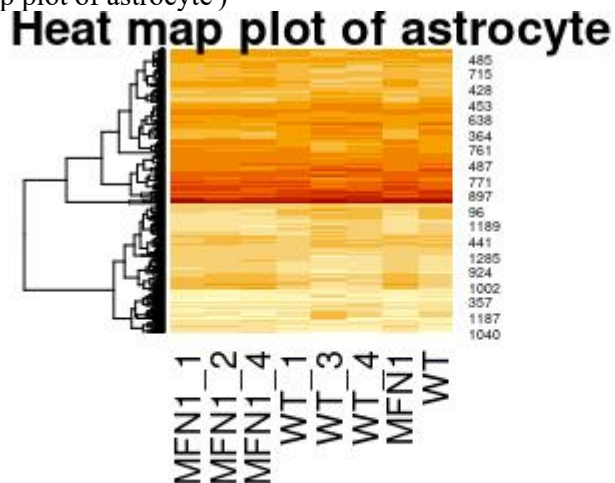

MFN1_1 vs WT_1

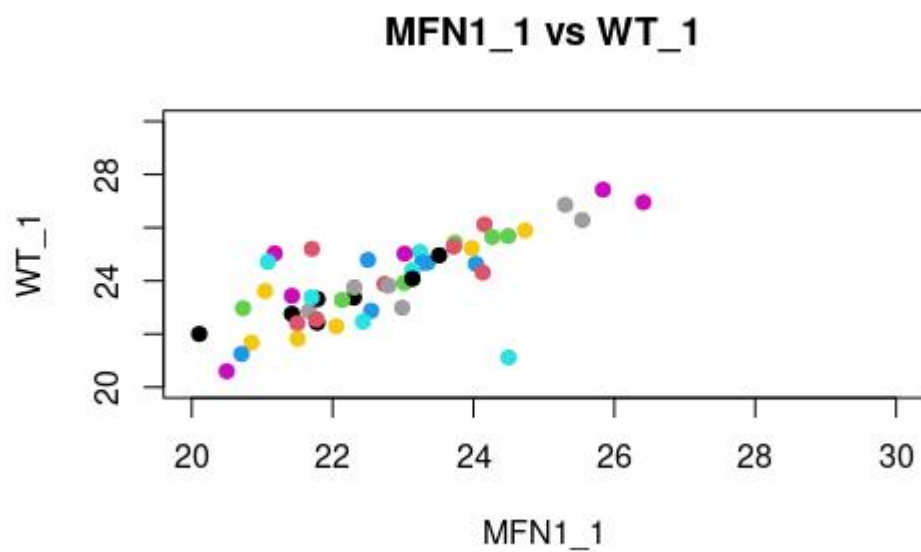

```
# Let me add legend to my plot
legend('topright', legend = c(astrocyte_data$T..Gene.names[1:50]), pch = 19, col = 1:50)
```

5

MFN1_1 vs WT_1

# I plot the heatmap next.
heatmap(as.matrix(astrocyte_data[2:9]), Colv = NA, scale = 'col', margins = c(10,10), main = 'Heat map plot of astrocyte')

Heat map plot of astrocyte

# Let me now plot Pie Charts
table(astrocyte_data$T..Gene.names[1:10])
item <- unique(astrocyte_data$T..Gene.names[1:10])
itemCount <- as.vector(table(astrocyte_data$T..Gene.names[1:10]))

# I will start by plotting a simple pie chart for astrocyte species
pie (x = itemCount, labels = item, radius = 0.5, col = 11:20, main = 'Pie chart for astrocyte species')
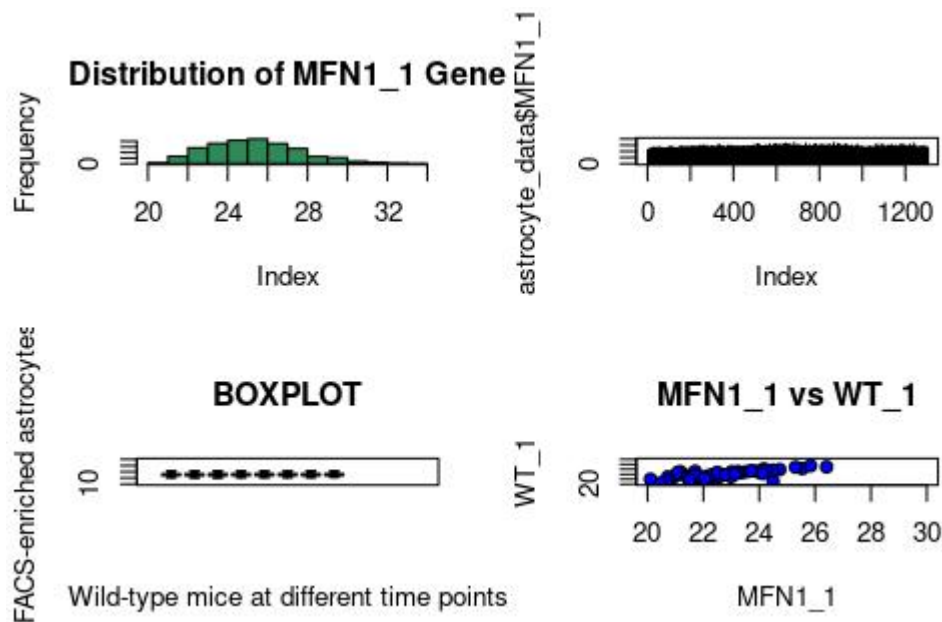

Pie chart for astrocyte species

Next, let me add edges and color my borders
pie (x = itemCount, labels = item, radius = 1.0, edge = T, border = 'red', col = 11:20, main = 'Pie chart for astrocyte species')

Pie chart for astrocyte species

# Let's arrange some of these plots as we usually see in publications
par(mfrow = c(2,2))

Distribution of MFN1_1 Gene (top-left histogram, Frequency vs Index)

(top-right scatter: astrocyte_data$MFN1_1 vs Index)

BOXPLOT — Wild-type mice at different time points (FACS-enriched astrocytes)

MFN1_1 vs WT_1 — WT_1 vs MFN1_1

LET US NOW GO FULLY INTO GGPLOTS

We are going to work with a new dataset
About data set: Growth and Toxigenicity of A. flavus on Resistant and Susceptible Peanut Genotypes. This study seeks to determine the reaction of peanut genotypes to Aflatoxigenic and non-aflatoxigenic A. flavus inoculation and also determine the mechanisms of their resistance. It was established that non-aflatoxigenic A. flavus grows faster than aflatoxigenic A. flavus. There was no significant difference in the incidence and severity of the A. flavus resistant genotypes (L027B and ICGV-03401) however, there were significant differences between resistant genotypes and the susceptible check Manipinta. This study also confirmed that non-aflatoxigenic A. flavus inoculation did not lead to aflatoxin production. Non-aflatoxigenic A. flavus identified could serve as a good biocontrol against aflatoxin contamination under field conditions. Additionally, peanut genotypes with resistance to post-harvest aflatoxin accumulation will resist the growth of A. flavus and subsequent aflatoxin accumulation.

# Install ggplot2
install.packages("ggplot2")
library(ggplot2)

# Import .csv file in R
aflatoxin_data <- read.csv(file.choose())
aflatoxin_data

# Start with defining the base data for ggplot
pl <- ggplot(data = aflatoxin_data)
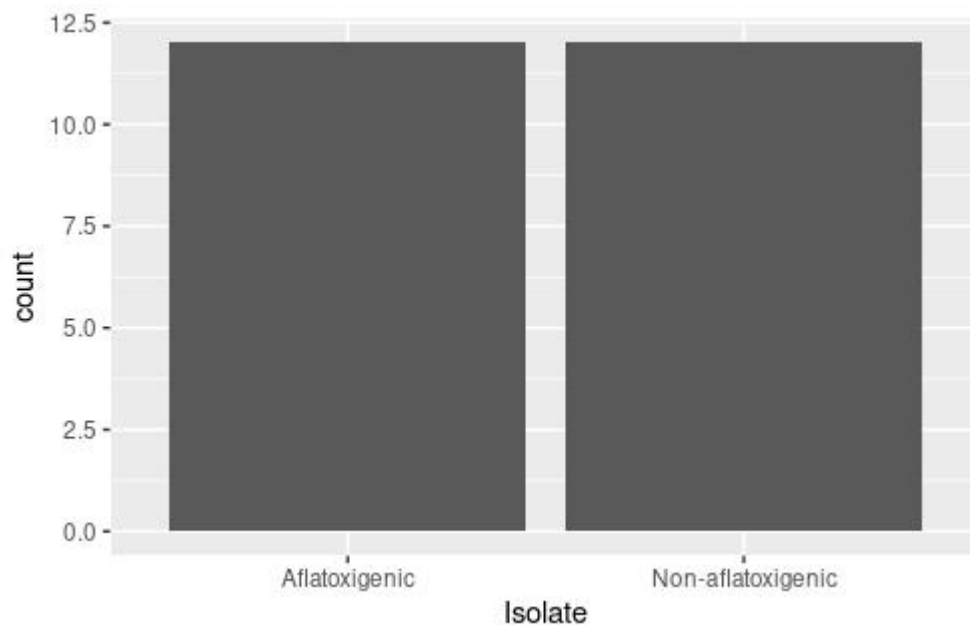

To the base, I will add what I want to plot and color
pl + geom_bar(aes(x=GENOTYPES))

# I will plot frequency of the data from a single column
pl + geom_bar(aes(y=Isolate))

# Let me flip the coordinates
pl + geom_bar(aes(y=Isolate))+coord_flip()

# See the frequency of each variable within the species.
# Install.package(reshape2)
# Melt the data to have something understandable by ggplot better
install.packages("reshape2")
install.packages("Rcpp")
library(reshape2)
melted_aflatoxin_data <- melt(aflatoxin_data)

# I want to produce a ttacked/continuous bar plot for genotypes.
ggplot(data = aflatoxin_data) + geom_bar(aes(x=GENOTYPES, y=Isolate, fill = GENOTYPES), stat = "identity")

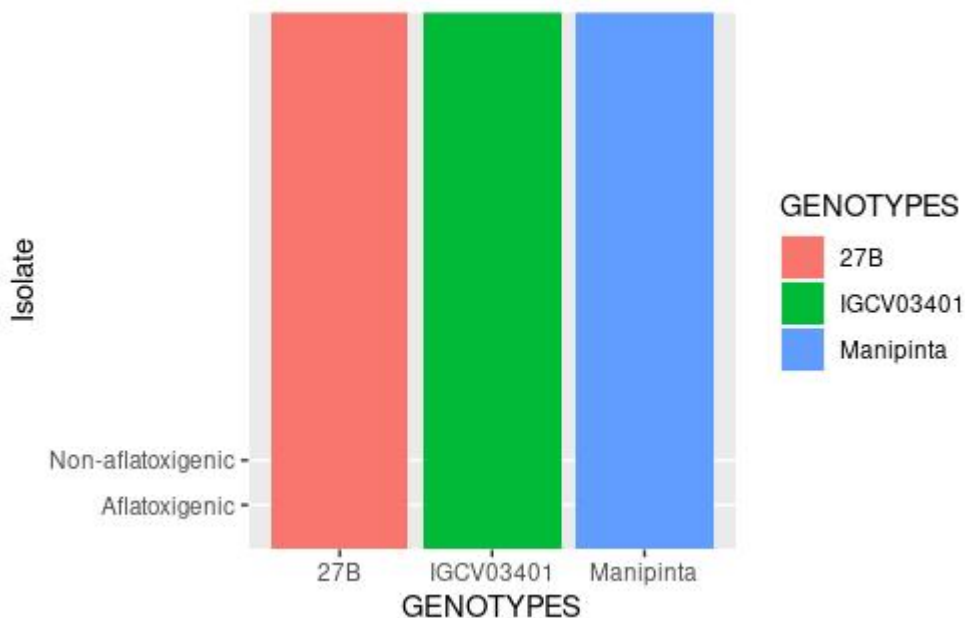

# Let me produce a multiple bar plot
ggplot(data = aflatoxin_data) + geom_bar(aes(x=GENOTYPES, y=Isolate, fill = GENOTYPES), stat = "identity", position = 'dodge')
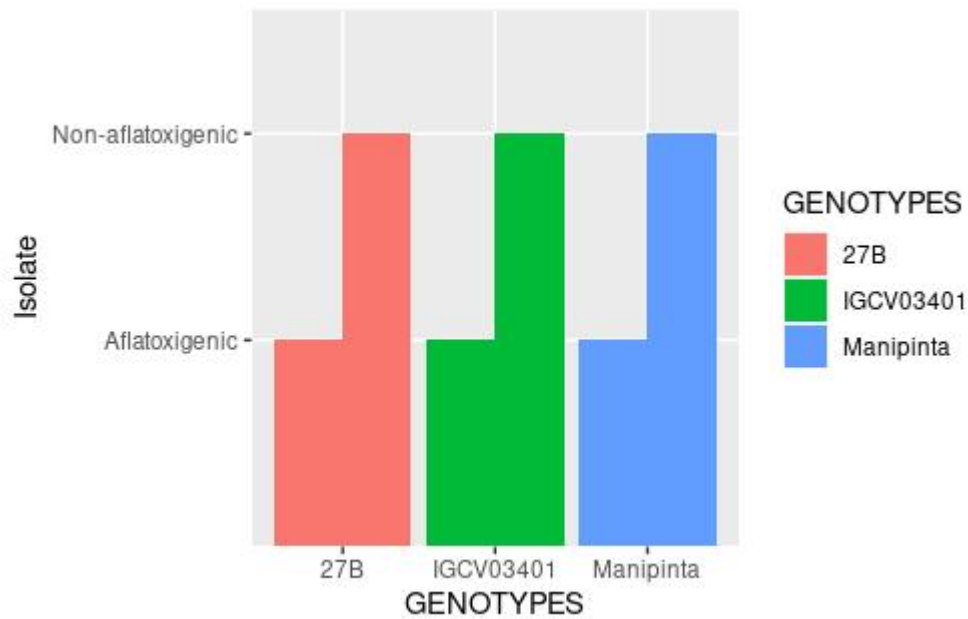

Let me plot a simple pie chart and label by genotypes
ggplot(data = aflatoxin_data) + geom_bar(aes(x=factor(1), fill = GENOTYPES), width = 1) +
coord_polar(theta = 'y')

I will add a theme of my choice
ggplot(data = aflatoxin_data) + geom_bar(aes(x=factor(1), fill = GENOTYPES), width = 1) +
coord_polar(theta = 'y') + theme_classic()
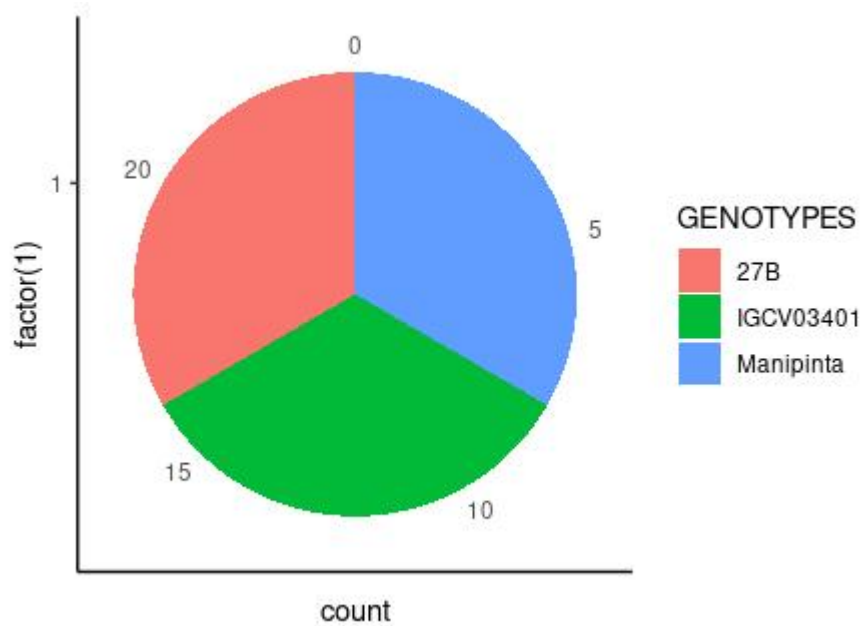

# Let me plot a simple histogram for aflatoxin_data
pl <- ggplot(data = aflatoxin_data)
pl + geom_histogram(aes(x=S_Day2, fill = GENOTYPES)) + facet_grid(. ~GENOTYPES)
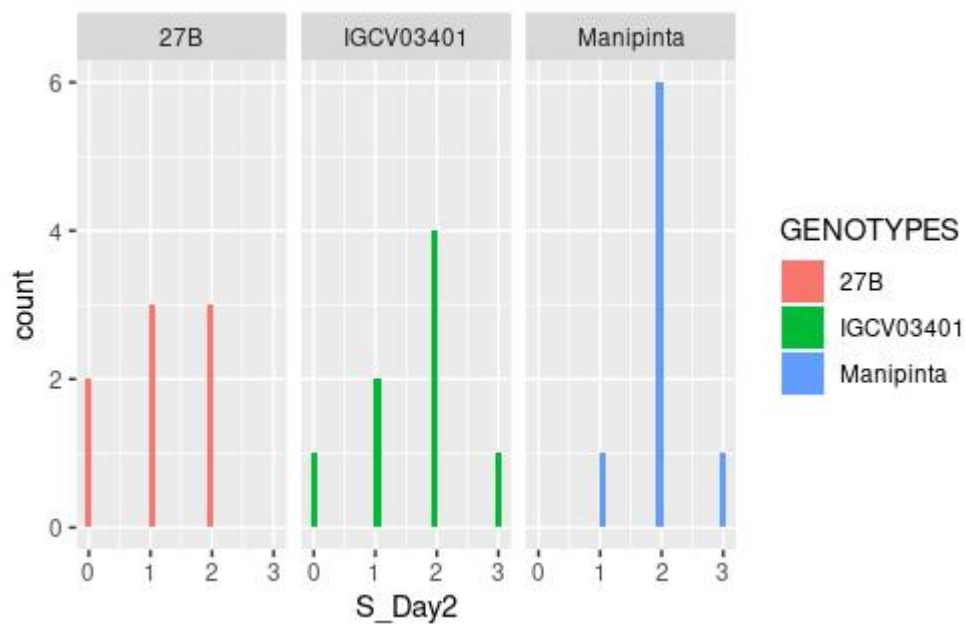

# I will add a color parameter
pl + geom_histogram(aes(x=S_Day2, fill = GENOTYPES), color = "black") + facet_grid(.
~GENOTYPES)
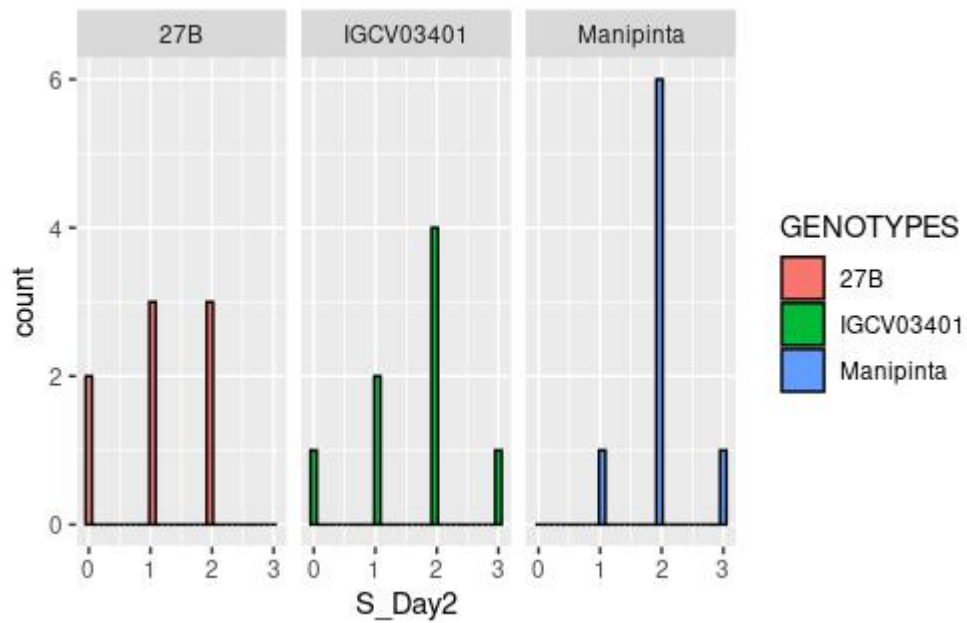

Let me construct a Scatter plot of S_Day8 against S_Day2 with red color
pl + geom_point(aes(x = S_Day2, y = S_Day8, color = 'red'))
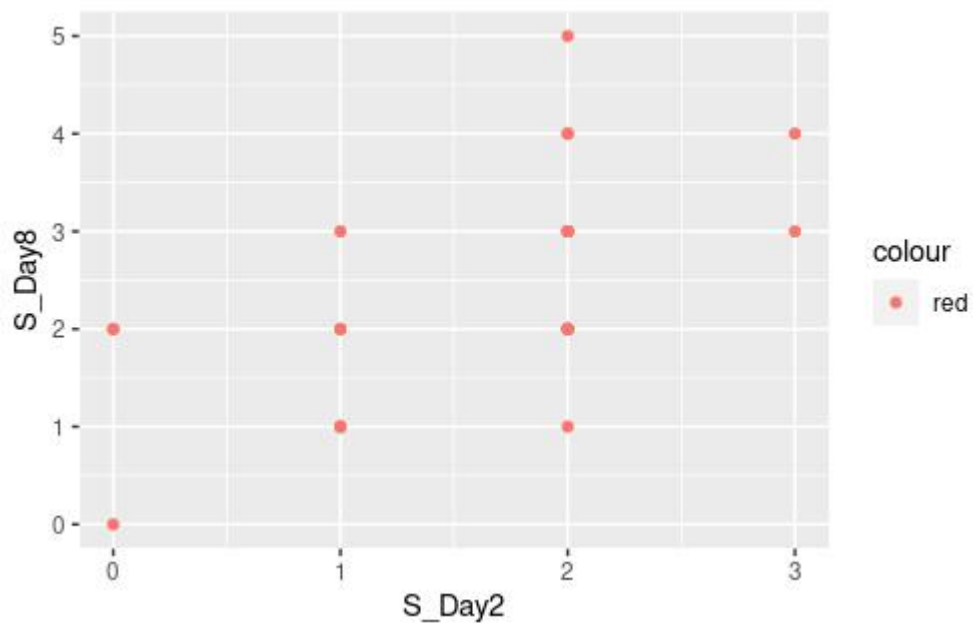

I will Color by Genotype (quite automated)
pl + geom_point(aes(x = S_Day2, y = S_Day8, color = GENOTYPES)) + theme_bw() +
ggtitle(label = 'Scatterplot', subtitle = 'Days')

Scatterplot

Days
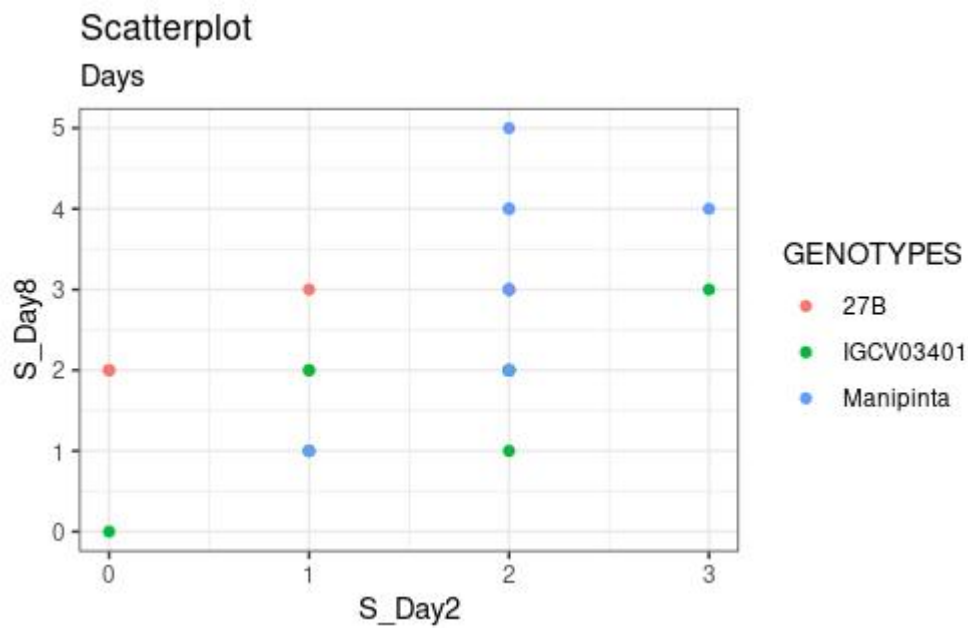

I will construct a boxplot plus a theme
pl + geom_boxplot(notch = F, aes(x= GENOTYPES, y = S_Day8, fill = GENOTYPES)) +
theme_classic()
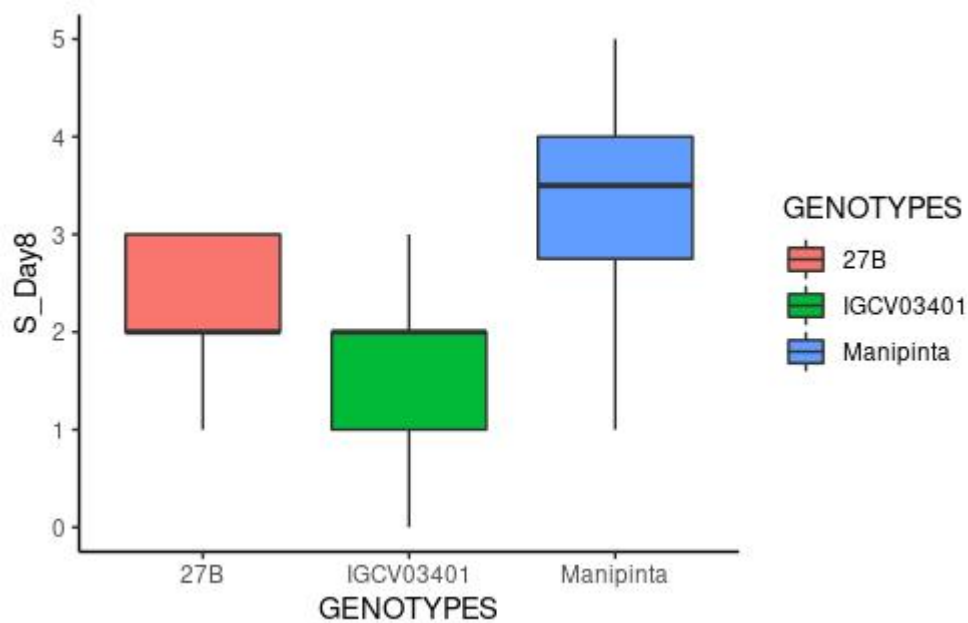

Heat map plotting
I will use melting methods to create heat map with ggtiles
meltCorData <- melt(cor(aflatoxin_data[3:8]))

# I start by setting my new ggplot
hm <- ggplot(data = meltCorData)
hm + geom_tile(aes(x = Var1, y = Var2, fill = value))
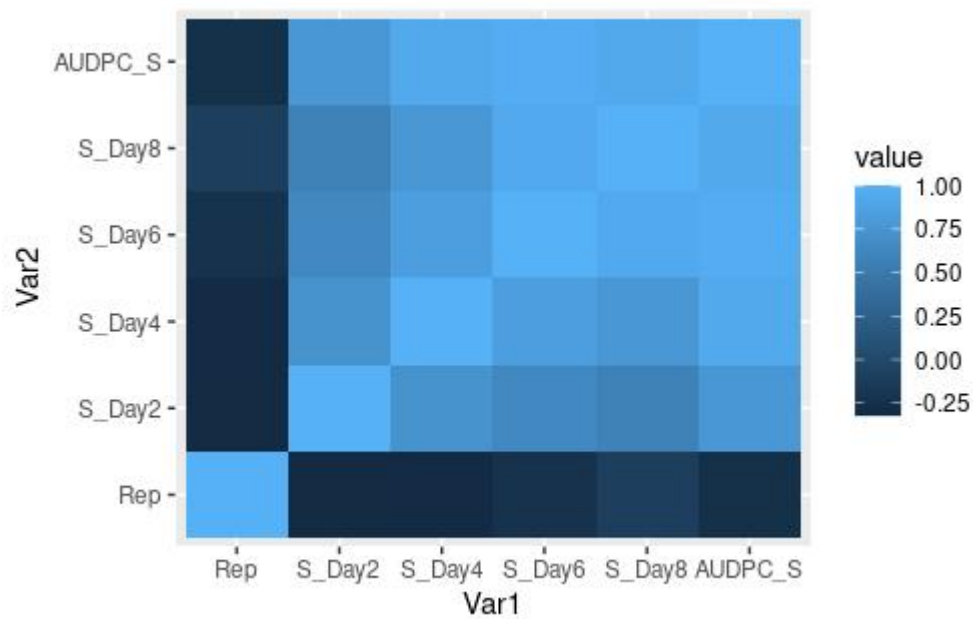

Let me start changing colors in heatmaps
hm + geom_tile(aes(x = Var1, y = Var2, fill = value)) + scale_fill_gradient2(low = 'red', high = 'blue')
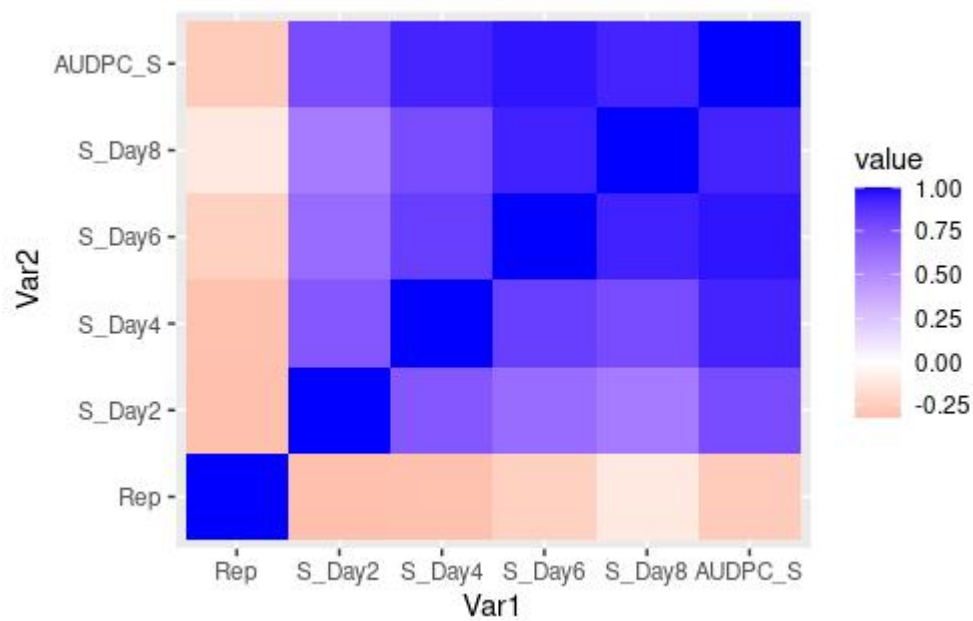

I will also use hex code
hm + geom_tile(aes(x = Var1, y = Var2, fill = value)) + scale_fill_gradient2(low = '#1687ee', high = '#d27C1c')

Let me change my x and y labels
hm + geom_tile(aes(x = Var1, y = Var2, fill = value)) + scale_fill_gradient2() + xlab('First Variable') + ylab('Second Variable')
